We report herein synthesis of a new triazole-based unsymmetrical macrocycle through Copper(I) catalyzed Alkyne - Azide Cycloaddition (CuAAC), using a copper(I)-N-heterocyclic carbene complex as catalyst. The obtained macrocycle was characterized by NMR spectroscopy and High Resolution Mass Spectrometry (HRMS). The complexation ability of the macrocycle towards various cations as well as its selectivity for a particular metal-ion was investigated by HRMS experiments.

**INTRODUCTION**

Macrocycles and their host-guest complexes hold a central place in supramolecular chemistry. To date, there are several well established procedures that enable efficient preparation of macrocyclic compounds such as high dilution technique, use of ions or small molecules as templates and dynamic combinatorial chemistry as well as combination of these techniques. One of the key requirements for the preparation of this type of compounds is use of a highly efficient reaction in the macrocyclization step.

Copper(I) catalyzed alkyne - azide cycloaddition (CuAAC) is one of the most widely used click reaction that found applications in many fields ranging from supramolecular chemistry to material sciences and medicinal chemistry. One of the most preeminent applications in supramolecular chemistry is the synthesis of mechanically interlocked structures such as rotaxanes and catenanes mainly due to the orthogonality of the reactive groups, mild reaction conditions (compatible with the noncovalent interactions required for building up these molecules) and its high yields.

This reaction has also been applied for synthesis of macrocycles with ion recognition properties. Relevant examples include macrocyclic peptides, sugar-containing macrocycles, crown ether and cyclophanes. Despite the numerous macrocyclic structures obtained by

CuAAC, its use in this field is somehow limited by the high dilution conditions imposed to favor macrocyclization over the oligomerization products which results in degradation of the catalyst before the reaction completion.\textsuperscript{14} Thus, to circumvent these issues, several catalytic systems were reported over the years displaying a moderate efficiency such as the use of copper tube flow reactors,\textsuperscript{15} immobilization of the catalyst on a solid support\textsuperscript{16} or use of a variety of copper sources in presence of various heteroaryl ligands.\textsuperscript{14}

In this context, we set to study the use of the copper(I)-N-heterocyclic carbene complex \textsuperscript{17} I (Figure 1) as single catalyst for the efficient synthesis of an unsymmetrical macrocycle through CuAAC click reaction without addition of any supplementary co-ligand.

\section*{RESULTS AND DISCUSSION}

\subsection*{Synthesis of the macrocycle precursor}

The macrocycle presented in this work was designed to be obtained by intramolecular CuAAC reaction. Therefore we needed to prepare first a precursor that contained azide and ethynyl reactive groups in the same molecule. To do so, we synthesized two key intermediates: compound 4 containing the azide reactive group and compound 7 bearing the ethynyl functionality (Scheme 1).

Compound 4 was obtained in four steps: first the triethylene glycol was unsymmetrically chlorinated and the chlorine atom in 1 was further substituted with azide group.\textsuperscript{18} Activation of the hydroxyl group for the nucleophilic substitution by tosylation yielded compound 3 that was subsequently reacted with excess of hydroquinone to afford the target azido-decorated intermediate 4.

In order to synthesize the ethynyl functionalized derivative 7, the tetraethylene glycol was first ditosylated\textsuperscript{19} and then reacted with a substoichiometric amount of monopropargyl hydroquinone 5 that was obtained by treatment of propargyl bromide with hydroquinone in large excess.

Next, the reaction between compounds 4 and 7 in presence of potassium carbonate yielded podand 8 in good yield (72\%).

Synthesis of the macrocycle 9

With the precursor 8 in our hands we moved to the macrocyclization reaction by CuAAC (Scheme 2). Use of copper(I)-N-heterocyclic carbene complex I as catalyst allowed the macrocyclization reaction to conveniently occur. Thus, the catalyst was dissolved in methanol and the high dilution required to favour the formation of the macrocycle over the oligomerization products was ensured by slow addition (8 hours) of the solution of 8 in DCM/methanol (1/3 v/v). In addition, the catalyst was air-stable.17 Macrocycle 9 was obtained in 44% yield after purification by column chromatography.

Formation of macrocycle 9 was confirmed by NMR and HRMS spectra (see Supporting Information).

Complexation studies

The complexation ability of the macrocycle 9 towards alkali metal-ions was further investigated. Compound 9 was able to form complexes with all tested metal-ions as inferred from ESI(+)-HRMS experiments. The ESI(+)-HRMS spectra of the complexes obtained by treatment of macrocycle 9 1.5 x 10^-3 M in acetonitrile as solvent with 3 equivalents of LiBF4, NaBF4, KBF4, RbBF4 or CsF showed peaks corresponding to 9•M+ adducts at m/z = 580.2886 [M+Li+], 596.2623 [M+Na+], 612.2365 [M+K+] 658.1851, [M+Rb+] and [9•Cs+] adducts, determined from ESI(+)-HRMS spectrum (Figure 2) were 0%, 100%, 92%, 73% and 95% respectively. The results were in agreement with a non-selective recognition behaviour towards the complexation of alkaline metal ions.

EXPERIMENTAL

General experimental data. All commercially available reagents were used without further purification. Thin layer chromatography (TLC) was performed on silica gel 60 coated aluminium F254 plates and visualised by UV irradiation at 254 nm or by staining with potassium permanganate solution. Preparative column chromatography was carried out using silica gel 60 (0.040-0.063 mm) from Merck. The NMR spectra were recorded on a Bruker Avance 400 MHz or Bruker Avance 600 MHz spectrometers. Chemical shifts (δ) are reported in parts per million (ppm) using residual solvent peak as internal reference. High resolution mass spectra were recorded on a Thermo Scientific (LTQ XL, Orbitrap) spectrometer, in positive ion mode, using Electrospray or APCI techniques.

2-(2-(2-Chloroethoxy)ethoxy)ethanol (1)

To a solution of triethylene glycol (33.5 mL, 37.5g, 250 mmol, 1 eq.) in chloroform (50 mL), pyridine (20.2 mL, 19.75g, 250 mmol, 1 eq.) and SOCl2 (18.2 mL, 29.75g, 250 mmol, 1 eq.) were added and the reaction mixture was stirred under reflux for 24h. After cooling at room temperature DCM (50 mL) was added and the reaction mixture was washed with water (40 mL). Next, the aqueous phase was extracted with DCM (2x25 mL). The combined organic phases were dried.
over anhydrous MgSO₄ and the solvent was evaporated under vacuum. The crude of reaction contained compound 1 in a mixture with unreacted triethyleneglycol and the corresponding dichloro-derivative. Vacuum distillation (0.16-0.20 mbar) yielded three fractions, first fraction collected between 92–94°C, the second fraction 99–106°C and a third fraction at over 109°C. Third fraction contained the highest amount of 1. Further purification by column chromatography on silica gel, using a gradient of ethyl acetate : petroleum spirit, 40–60 °C: 1:2 to 1:0 v/v (Rf: 0.34) as eluent resulted in pure 5.96 g of 1 (15 % yield) as colourless liquid. ¹H NMR (400 MHz, CDCl₃), δ (ppm): 3.60–3.66 (overlapped peaks, 4H, CH₂), 3.69 (s, 4H, CH₂), 3.72–3.78 (overlapped peaks, 4H, CH₂). ¹³C APT NMR (100 MHz, CDCl₃), δ (ppm): 42.8, 61.9, 70.5, 70.8, 71.5, 72.6.

2-((2-Azidoethoxy)ethoxy)ethanol (2)

To a solution of 1 (3 g, 17.8 mmol, 1 eq.) in water (30 mL), NaN₃ (11.57 g, 178 mmol, 10 eq.) and NH₄Cl (11.2 g, 213.6 mmol, 12 eq.) were added. The resulted solution was stirred at 90 °C for 24 h. After cooling at room temperature and filtration of the precipitated inorganic salts, the aqueous phase was extracted with ethyl acetate (7x40 mL). The combined organic phases were dried over anhydrous MgSO₄ and the solvent was evaporated under vacuum. We obtained 2.86 g (92 % yield) as a yellow liquid that was used in the next step without further purification.

TLC (silica gel, ethyl acetate/petroleum spirit, 40–60 °C, 2:3 v/v, Rf=0.34). ¹H NMR (600 MHz, CDCl₃), δ (ppm): 3.40 (t, 3J= 5.0 Hz, 2H, CH₂), 3.62 (t, 3J= 4.4 Hz, 2H, CH₂), 3.66–3.71 (overlapped peaks, 6H, CH₃), 3.75 (t, 3J= 4.4 Hz, 2H, CH₂). ¹³C APT NMR (150 MHz, CDCl₃), δ (ppm): 50.8, 61.9, 70.2, 70.6, 70.8, 72.6.

2-((2-Azidoethoxy)ethoxy)ethyl 4-methylbenzenesulfonate (3)

Compound 2 (2.62 g, 14.95 mmol, 1 eq.) and tosyl chloride (2.85 g, 14.95 mmol, 1 eq.) were dissolved in DCM (20 mL). The solution was cooled on an ice bath and KOH (3.35 g, 59.8 mmol, 4 eq.) was added in small portions. The reaction mixture was stirred for 90 min at 0 °C and at room temperature for additional 20 h. Next, water (50 mL) and DCM (20 mL) were added and the organic and aqueous phases were separated. The aqueous phase was extracted with DCM (4x20 mL). The combined organic phases were washed with brine (20 mL) and dried over MgSO₄. After evaporation of the solvent 4.17 g compound 3 (yellow liquid, 85 % yield) were obtained. TLC (silica gel, ethyl acetate : petroleum spirit, 40–60 °C, 1:1v/v, Rf= 0.54). ¹H NMR (600 MHz, CDCl₃), δ (ppm): 2.45 (s, 3H, CH₃), 3.37 (t, 3J= 5.0 Hz, 2H, CH₂), 3.60 (s, 4H, CH₂), 3.64 (t, 3J= 5.0 Hz, 2H, CH₂), 3.70 (t, 3J= 4.8 Hz, 2H, CH₂), 4.16 (t, 3J= 4.8 Hz, 2H, CH₂), 7.34 (d, 3J= 8.2 Hz, 2H, CHAr), 7.80 (d, 3J= 8.2 Hz, 2H, CHAr). ¹³C APT NMR (150 MHz, CDCl₃), δ (ppm): 50.8, 60.5, 69.0, 69.4, 70.2, 70.8, 71.0, 128.1, 130.0, 133.2, 145.0.

Fig. 2 – ESI(+)-HRMS spectra of 9 1.5 mM in acetonitrile, in presence of equimolar amounts of LiBF₄, NaBF₄, KBF₄, RbBF₄ and CsF (top). Comparison of the experimental spectra (top) and simulated isotopic patterns of [9Li⁺], [9Na⁺], [9K⁺], [9Rb⁺] and [9Cs⁺] adducts (bottom).
4-(2-(2-azidoethoxy)ethoxy)ethoxy)phenol (4)

A solution of compound 3 (3.796 g, 11.54 mmol, 1 eq.) in acetonitrile (150 mL) was flushed with argon, then hydroquinone (6.347 g, 57.7 mmol, 5 eq.) and K$_2$CO$_3$ (15.92 g, 115.4 mmol) were added. The reaction mixture was stirred at reflux, under argon atmosphere, for 24 h. After evaporation of the solvent, water (150 mL) was added and the mixture was extracted with ethyl acetate (5 x 50 mL). The combined organic phases were washed with brine (100 mL), dried over anhydrous MgSO$_4$ and the solvent evaporated under vacuum.

The crude of reaction was purified by column chromatography using silica gel as stationary phase and a gradient of ethyl acetate: petroleum spirit, 40–60 °C 1:4 to 1:2 v/v as eluent. Compound 4 (0.46 g (15 % yield) was obtained as a brown oil.

**TLC** (silica gel, ethyl acetate : petroleum spirit, 40–60 °C 1:2; R$_f$=0.22). $^1$H NMR (600 MHz, CDCl$_3$), $\delta_\text{n}$ (ppm): 3.39 (t, $^2J$ = 5.0 Hz, 2H, CH$_2$), 3.66–3.71 (overlapped signals, 4H, CH$_2$), 3.84 (t, $^2J$ = 4.8 Hz, 2H, CH$_2$), 4.07 (t, $^2J$ = 4.9 Hz, 2H, CH$_2$), 4.51 (brs, 1H, OH), 6.75 (d, $^2J$ = 9.0 Hz, 2H, CH$_2$), 6.80 (d, $^2J$ = 9.0 Hz, 2H, CH$_2$). $^{13}$C APT NMR (150 MHz, CDCl$_3$), $\delta_\text{c}$ (ppm): 50.9, 68.3, 70.1, 70.2, 70.9, 71.0, 71.1, 116.2, 116.5, 150.4, 151.9.

4-(2-(2-azidoethoxy)ethoxy)ethyl 4-methylbenzenesulfonate (5)

Tetraethylene glycol (29.13 g, 150 mmol, 1 eq.) in CH$_2$Cl$_2$ (150 mL) was treated with tosyl chloride (57.2 g, 300 mmol, 2 eq.). The mixture was cooled on an ice bath and KOH (67.2 g, 1.2 mol, 8 eq.) was added in small portions. The reaction mixture was stirred at 0 °C for 3 h and at room temperature for additional 20h. After this time, water (300 mL) and DCM (150 mL) were added and the organic phase was separated and washed with water (100 mL). The combined aqueous phases were extracted with DCM (1x150 mL and 1x100 mL). The combined organic phases were washed with water (100 mL), dried over MgSO$_4$ and the solvent was evaporated in vacuum.

We obtained 66.18 g of 6 (68 % yield) as a colourless liquid. **TLC** (silica gel, ethyl acetate : petroleum spirit, 40–60 °C 1:1; R$_f$=0.26). $^1$H NMR (400 MHz, CDCl$_3$), $\delta_\text{n}$ (ppm): 1.10 (t, $^3J$ = 7.4 Hz, 3H, CH$_3$), 1.26–1.30 (overlapped signals, 6H, CH$_2$), 2.86 (t, $^3J$ = 8.0 Hz, 2H, CH$_2$), 3.48 (d, $^3J$ = 8.4 Hz, 2H, CH$_2$), 6.75 (d, $^3J$ = 8.5 Hz, 2H, CH$_2$). $^{13}$C APT NMR (150 MHz, CDCl$_3$), $\delta_\text{c}$ (ppm): 18.7, 68.8, 69.4, 70.7, 70.9, 128.1, 130.0, 133.2, 145.0.

CONCLUSIONS

In summary, we described synthesis and characterization of a new triazole-based unsymmetrical macrocycle, using a precursor that contained in the same molecule two reactive functional groups. The triazole ring was efficiently formed in the macrocyclization step by CuAAC reaction in presence of a copper(I)-V-heterocyclic carbene complex as catalyst. Complexation experiments showed that the synthesized macrocycle was able to recognize all the investigated alkali metal-ions, namely Li+, Na+, K+, Rb+ and Cs+. However, the competition experiments were in agreement with a non-selective complexation behaviour. The high macrocyclisation yield and the ease of the procedure prompts toward future design and synthesis of more selective and specific triazole-based macroyclic receptors for metal ions.
